Description

S6-1K8Y500 series is specially designed for sports Lighting and industrial lighting applications. It is constant current LED driver that operates from 220-400Vac with DMX&DALI-2 programming dimming function. This Rectangle integrated structure enables it to have a better heat dissipation cooler, significantly improving reliability and extending product life. To ensure trouble free operation, protection is provided against input surge, output over voltage, short circuit, and over temperature. The better thermal design and high efficiency enable the driver to operate with high reliability, and extending product lifetime. Overall protection is provided against lightning surge, output over voltage, short circuit, and over temperature, to ensure low failure rate.

CCC CE CB EAC 18 FC UL LISTED E332689 SAA Class P

Product Features

- Input voltage range: 198~440Vac;
- Constant current design;
- DMX -RDM control optional, Support RDM control mode & controller address setting;
- Support flashing function with maximum of 6 flashes per second;
- Non-Isolated Class I Driver;
- Efficiency up to 97%;
- 3*600W channels independently output;
- DMX&DALI-2 control interface;
- Dim-to-off; No glow after Dim-to-off;
- Max remote distance 300 meters;
- Surge protection: 10KV line-line, 10KV line-earth @ 2Ω;
- Multiple protection: SCP, OVP, OTP;
- IP66, IK08 design for indoor and outdoor applications;
- 5 years warranty.

Application

Stadium lighting
Area and flood lighting
High-bay lighting

Note: Factory Default Output Logarithmic Curve.

Implementation: DMX512 Daisy chain
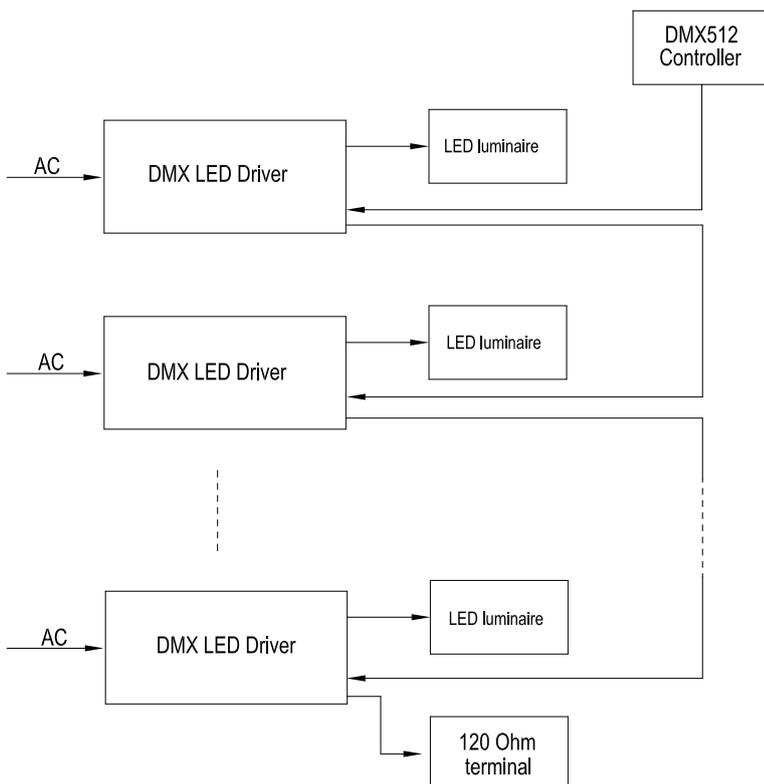

Note:

[1].Up to 32 drivers may be daisy-chained, terminated by a 120 Ohm resistor (connected between DMXA & DMXB as the last driver).

[2].300m maximum length.

[3].100m maximum between drivers.

[4]. For best performance, a characteristic impedance of 120 Ohm should be maintained for the entire length of the control wire.

Programming Link (DMX&DALI-2)

■ **For Dali**
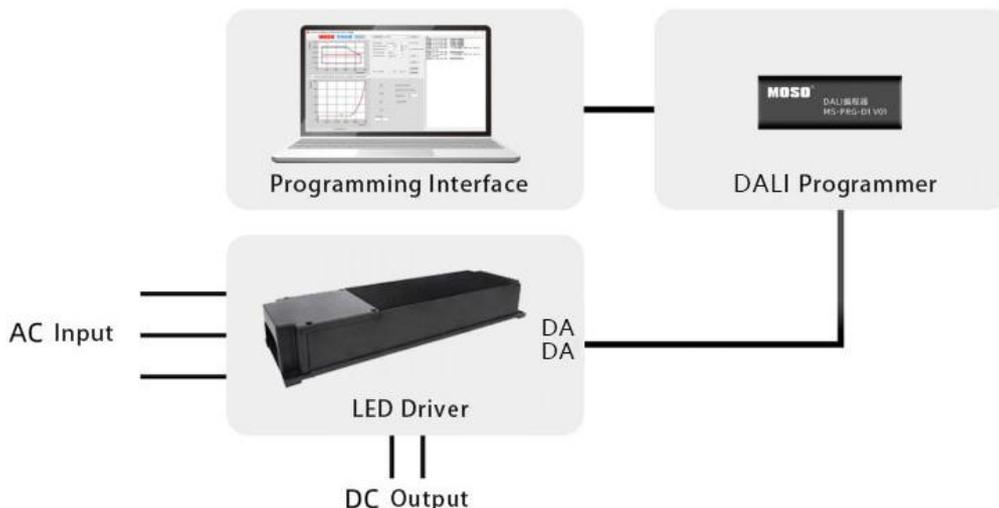

■ **For DMX**
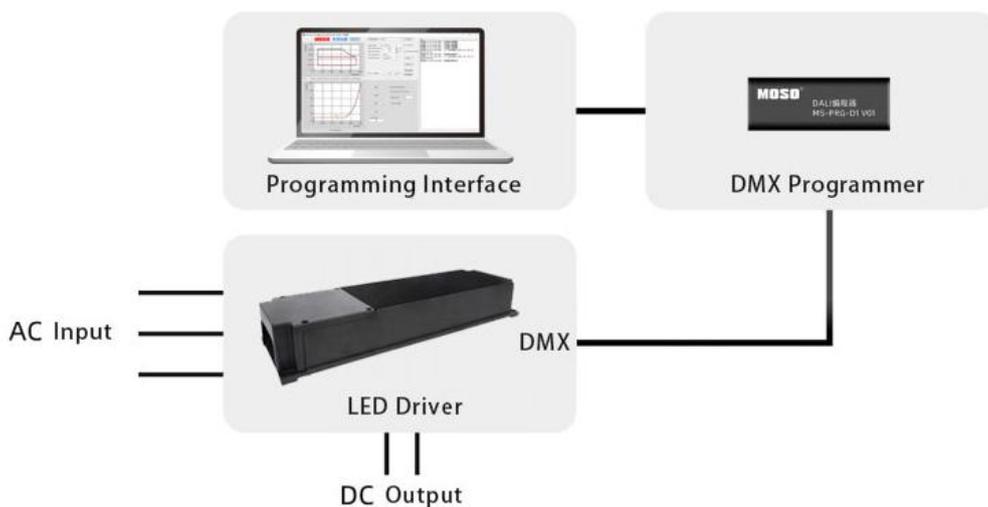

1. Dimming Mode Switching for DALI-2 & DMX-RDM

1.1 Switching from DALI-2 Dimming to DMX-RDM:

    a. After connecting the DMX programmer to computer, click on the software "Scan Port" button;

    b. Click "Read Cfg" to import the corresponding model's DMX configuration file (Six cfg files for S6-1200W/1500W/1800W will be provided in advance by MOSO);

    c. Click 'Set' button to transmit the .cfg file into the driver's MCU;

    d. After setting and restarting the driver, the software interface displays the DMX dimming mode, indicating successful conversion;

    Note: If the third step fails to set, select "FFFFFFFFFFFF" for the Device UID and reset the driver.

1.2 Switching from DMX-RDM to DALI-2 Dimming:

    a. After connecting the DALI programmer to computer, click on the software "Scan Port" button;

    b. Click "Read Cfg" to import the corresponding model's DALI configuration file (Six cfg files for S6-1200W/1500W/1800W will be provided in advance by MOSO);

    c. Click 'Set' button to transmit the .cfg file into the driver's MCU;

    d. After setting and restarting the driver, the software interface displays the DALI-2 dimming mode, indicating successful conversion;

2. Operating instructions

DALI / DMX visual software programming

1. Use corresponding programmer to connect with driver.

2. The output current of the three channels is independent. When setting the current, each channel needs to be modified.

3. The current parameters and configured driving parameters can be read and set.

4. Time dimming. Set the timing control function, which supports 7 segments.

5. Driver OTP and Lamps OTP. The Driver OTP and Lamps OTP parameters can be set according to the needs of customers.

3. NTC

The recommended value of NTC resistance is 100K Ω, BETA: 4050

NTC resistance value changes with temperature:

40℃	48.6KΩ-58.8KΩ;
60℃	21.8KΩ-26.3KΩ;
65℃	18.1KΩ-22.1KΩ;
70℃	15.1KΩ-18.6KΩ;
75℃	12.7KΩ-15.8KΩ;
80℃	10.7KΩ-13.4KΩ;
85℃	9.1KΩ-11.5KΩ;

4. DMX interface parameters
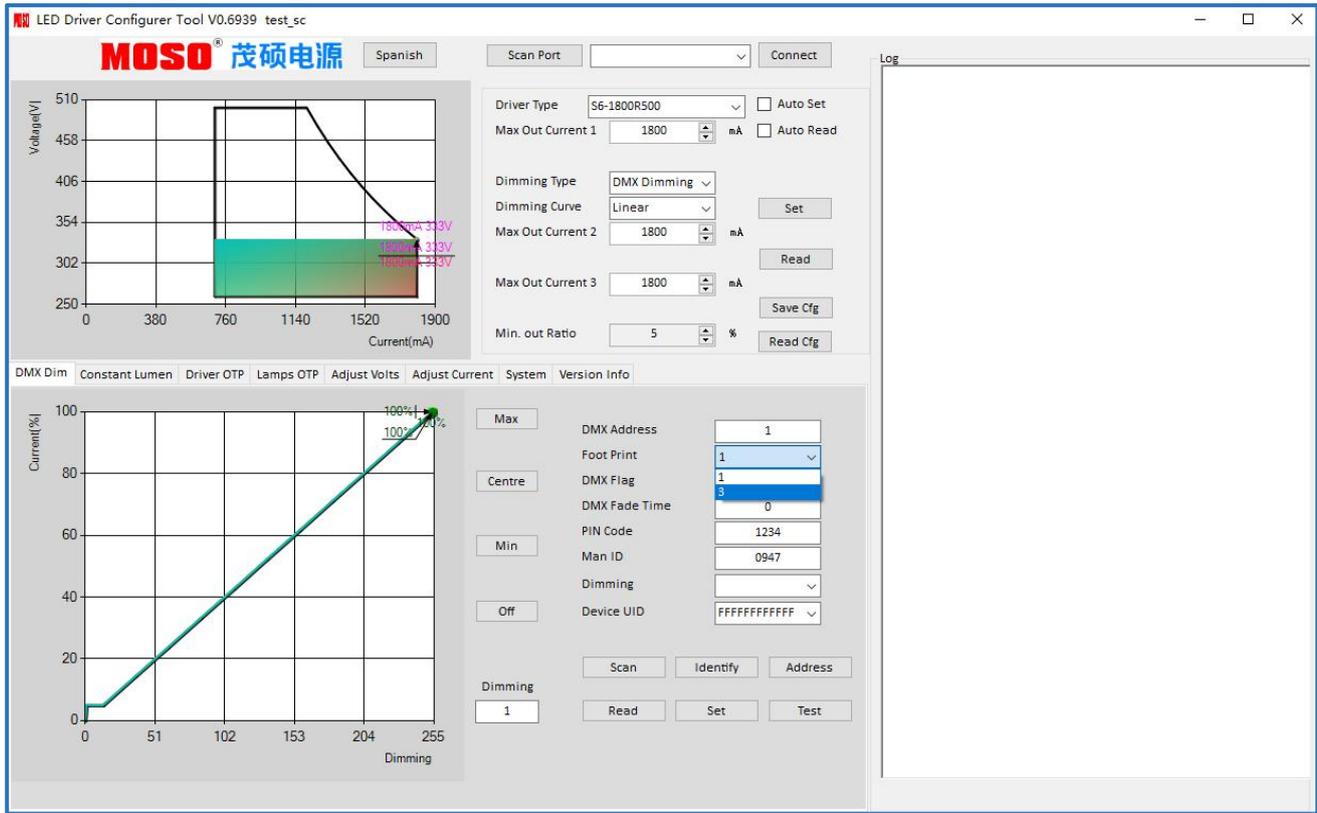

◆ Scan

When the DMX control system is connected to a new driver, customer need to click the "**Scan**" button to scan the new driver. The Configurer Tool will automatically read the Device UID of the newly connected driver in the system，The UID of the driver is displayed on the right LOG page. When the Device UID displayed by the Configurer Tool is consistent with the actual device UID of the driver, you can perform the next operation on the DMX driver, otherwise the software will display "read basic parameter fail".

◆ Identify

The specific position of the driver can be identified by this function. Click the "**Identify**" button, and the light connected to the corresponding driver will flash to indicate its location.

◆ Foot print

This function is used to assign the number of addresses. If 1 is selected, the three channels share a single DMX address, and if 3 is selected, the three channels use three different DMX addresses.

◆ Address

Driver assignment DMX address can be modified. With this function, customer can enter any number within 512 into the "**DMX Address**" to reassign the DMX address of a driver. Entering the number, then click "**Address**" to complete the address setting.

The number of driver channels corresponds to the number of **DMX addresses** occupied by the driver. The Address window displays the address of the first channel. For example, if the address of the first channel is 6, the address of the second channel is 7 and the address of the third channel is 8.

⚠ **Note:** So for multichannel DMX drivers, the maximum configurable address equals：512- (number of channels) +1 ，Unlike the "**Address**" button, which can

only modify the DMX address of the driver, "**Set**" can set all the DMX parameter modified by customer into the driver.

◆ DMX Flag

The software displays the hexadecimal code and converts the corresponding binary code to correspond to functions. 1 indicates that the function is enabled and 0 indicates that the function is disabled. At present, only ten functions are supported.

For example, 23F=10 ,0011 ,1111 indicates that functions 0~5 and 9 are enabled.

◆ Dimming

This function is used **to** read the dimmer value data of the driver in real time and return the value.

◆ DMX fade time

The Fade Time will be started when the system changes the dimming value. The maximum of Fade Time for each steps can reach 2500ms，The calculation method is set value multiplied by 10ms.

The longest total time spent will be 635 seconds when dimming value has changed from 0 to 254 with maximum Fade Time. The calculation formula is as follows:

255 steps (whole dimming value has changed)*2500ms (maximum fade time) ÷1000 (Unit conversion: from microseconds to seconds) =635 seconds.
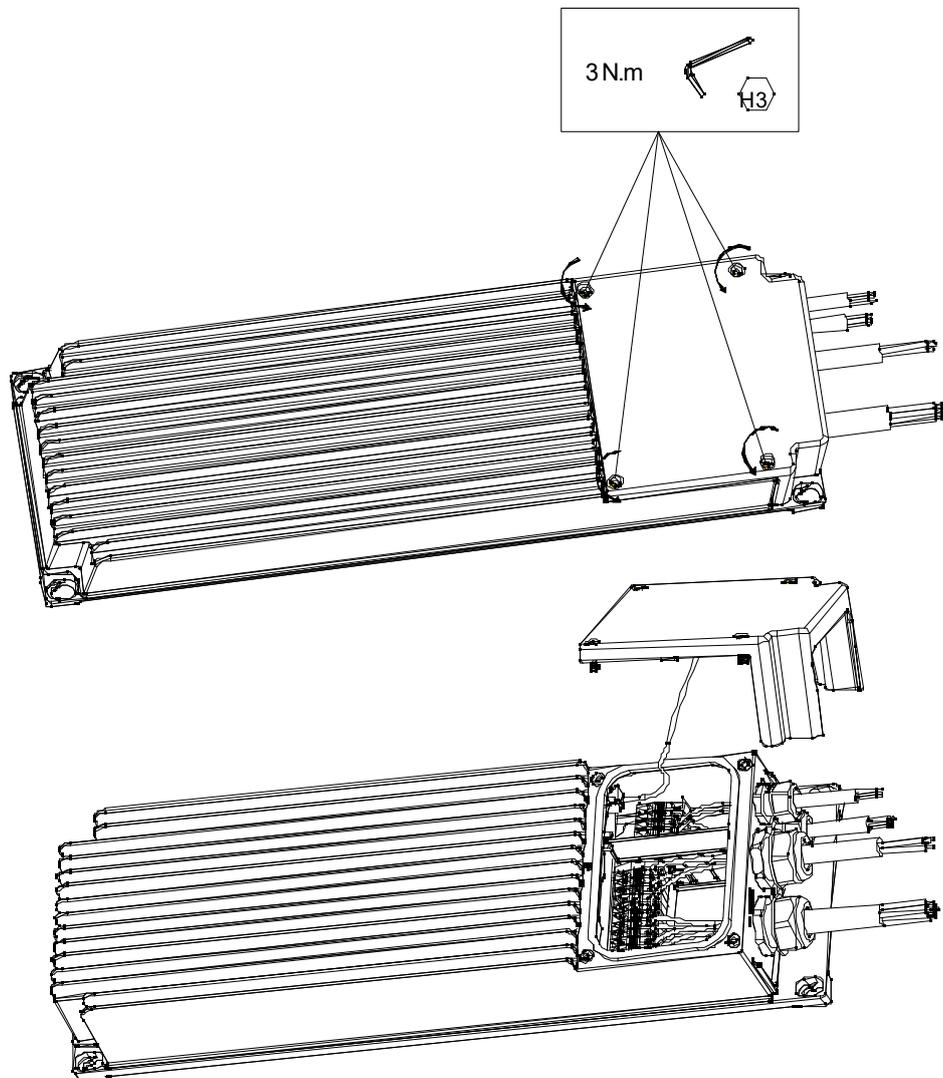

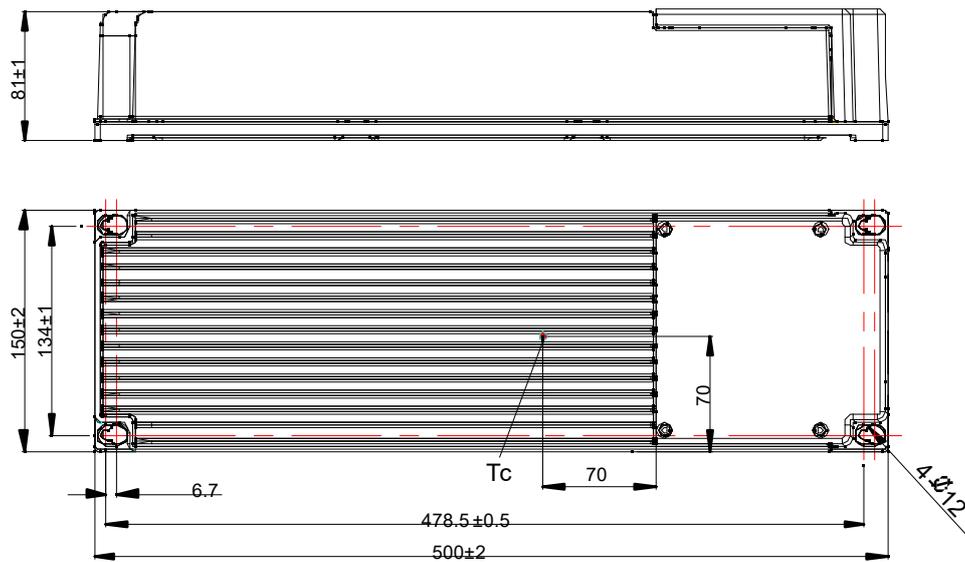

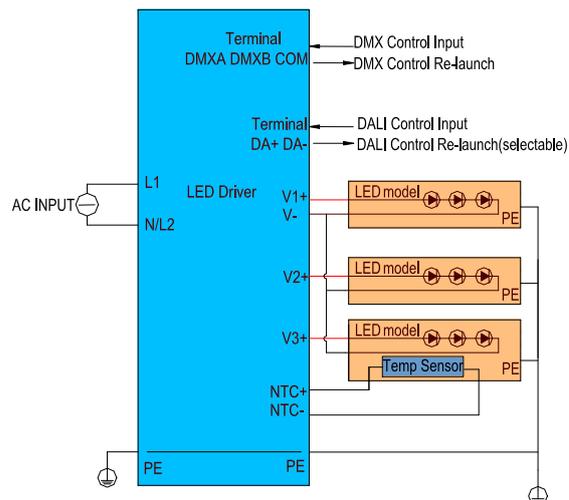

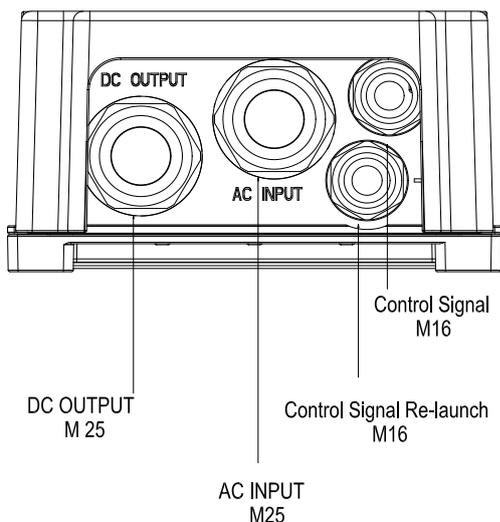

◆ PIN Code

The password for each driver to join the customer's control system.

◆ Device UID

A window used to select the device UID of the driver. Use the **"Scan"** button to automatically switch the device UID of the driver newly connected to the system, or manually select the device UID previously connected.

CAUTIONS

1. After the wiring is connected according to the datasheet, ensure that the gland is effectively locked to prevent water from damaging the driver.
2. When closing the electrical cover after wiring, ensure that the four fixing screws effectively tightened to prevent water from damaging the driver.
